

## **BRINE FILTRATION**

EASTLINE'S brine filtration equipment are the VPL types that are compact, stackable, and can save enormous rig space while delivering quality filtered brine. Workover and completion operations often generate solids that are picked up and transported by brine fluids.

Eastline appreciates the difficulty our customers will encounter in removing the solids if they are carried into the formation or perforations and can often result in lower productivity.

In order to eliminate the possibility of production impairment or formation damage, brine filtration is used to remove solids from the system.

Eastline filtration equipment is deployed continuously during all phases of completion operations as long as brine fluid is in the hole with the objective of:

- ▶ Protecting the producing formation
- ▶ Removing solids from completion fluid
- ▶ Assuring an uninterrupted supply of filtered, solid-free completion fluid
- ▶ Ensuring tool operability
